ABOUT ME

T-Shaped Software Engineer with a specialization in Infra/Platform Engineering. I have experience in a variety of organizations in the US, ranging from small startups (Glide) to Fortune 500 Companies (Compass), plus working as a Software Engineer for ventures all around the globe.

EXPERIENCE

Platform Engineer

February 2024 - August 2024

Span (US)

- Helped in the splitting of the one database into main and analytics, carefully moving customer datasets to a new RDS instance without any downtime, necessary for the next generation of the data pipeline.
- Drove and executed the migration off two different vendors to a standard EKS Cluster using FluxCD for Continuous Delivery, resulting in a considerable decrease of the overall infrastructure spendings.
 - Created a few reusable Terraform modules used for both production and staging clusters.
 - Separate node groups according to workloads.
 - Istio for the Ingress infra
 - Migrated the in-house app, Airbyte and Dagster into the new clusters.

Engineering Manager & LatAm Coordinator

April 2021 - January 2024

Compass (US)

I had a double role, first being an Engineering Manager of teams closely related to Glide, supporting a group of 12 people, and then growing the Argentina based team from 10 people to 30+, assembling a recruitment team along the way.

- Created an Android team that built and launched the Glide Android app from scratch.
- Led the implementation of data privacy policies and tools for a successful compliance of CCPA for Glide. This included the complete implementation of DataGrail to help manage and process requests.
- Managed teams related with every aspect of Glide, such as Web, Data and Mobile iOS Engineering to ensure its Business continuity.

Engineering Manager & Argentina Coordinator

March 2019 - March 2021

Glide (US)

Glide is a Real Estate Transaction Management Software, designed to help property managers fill forms, electronically sign documents, ensure compliance and make TCs and Agents lives easier. I wore many hats: Software Engineer, Engineering Manager and Argentina Coordinator.

- I was the first hire of Glide in Argentina and drove the growth of the team up to 10 people.
 - I ran a production application with ~6k daily active users with high availability while keeping costs to a budget.
 - Engineered different features of the Glide Application using Python, NodeJS and React.
-

Founder

April 2017 - February 2019

Codexia (Argentina)

I Co-founded a small development agency, completely managing two projects including a small team of 3 Engineers. We successfully delivered three customer-facing products based on my proven stack composed of LoopbackJS (back end) + PostgreSQL (database), Angular + Material Design (web front end) and NativeScript for mobile apps when needed.

Senior Software Engineer

April 2016 - March 2017

PayrollPanda (Malaysia)

I worked on their two products: PayrollPanda and Jibble. Both were based on NodeJS, MongoDB and Backbone. Some important things I've accomplished:

- Simplified architecture with the replacement of a RabbitMQ instance with a much simpler job scheduler (Agenda).
- Introduced automated tests and a reliable build and deploy process to Heroku through Travis CI Server.

Software Engineer

May 2015 - March 2016

GreyStar Solutions / Zija (US)

Perl Developer. I fixed bugs, implemented new features and made some recommendations to modernize a rather old-styled MLM (multi-level marketing) system written in Perl and using MySQL.

Software Engineer

November 2013 - May 2015

Onapsis (Argentina)

Being the frontend architect and lead developer for Onapsis (Yeoman, Grunt, Bower, RequireJS, BackboneJS, jQuery) I created the first version of the modern FE for their main product.

Software Engineer

May 2012 - October 2013

CuatroGC (Argentina)

Along with three friends we launched a small startup.

I was PM and Developer on a project: Dingo: An online Bingo game engine 100% written in Javascript. Technologies involved: NodeJS, ExpressJS, BackboneJS, Twitter Bootstrap.

Software Engineer

May 2009 - April 2012

Bet3000 (Germany)

Sports betting company based in Munich, Germany.

- I worked as a Full-stack Engineer. Added complexity because of the big amount of db transactions in real time that the site supports (MySQL) due to live bets (Perl + MySQL + PrototypeJS + jQuery).
- I proposed Chef as an automated tool to manage Kiosk terminals spread all over Germany that we implemented with the DevOps team. Still being used.

Different Software Engineer and SysAdmin roles

February 1999 - April 2009

During this period I had 7 different roles where a few accomplishments that stand out are:

- Developed a client-side app for an Internet Kiosk App using Mono (.NET) on Linux
- Migrated root nameserver for the .ar zone from OpenBSD to FreeBSD.
- Deployed Y2K patches on Sun Solaris Servers

EDUCATION

4-year Bachelor in Information Systems at the Universidad Tecnológica Nacional.
