ABOUT ME

T-Shaped Software Engineer with a specialization in Infra/Platform Engineering. I have experience in a variety of organizations in the US, ranging from small startups (Glide) to Fortune 500 Companies (Compass), plus working as a Software Engineer for ventures all around the globe.

EXPERIENCE

Senior Engineer | [Span](#) (US)

February 2024 - present

Planned and executed the creation from scratch of an EKS Cluster using Terraform and [FluxCD](#), resulting in a considerable decrease of the overall infrastructure spendings vs previous vendor.

Created a few reusable Terraform modules used for both production and staging clusters.

Separate node groups according to workloads and other needs, using node selectors, taints and tolerations.

I used [Istio](#) for the Ingress infra

Migrated all apps from the previous vendor into the new cluster.

As Co-Owner of the Data Pipeline

Planned and executed the upgrade of all our RDS Postgres instances from 16 to 17 with no downtime, using Blue/Green deployments.

Created a few new data pipelines end to end to fetch data from different vendors into the app: added new incremental streams to Airbyte and created the necessary Dagster assets.

Routinely assist debugging and solving all kinds of issues: customer facing data quality issues, performance, Kubernetes specifics, and more.

Engineering Manager | [Compass](#) (US)

April 2021 - January 2024

I joined through the acquisition of Glide, as an Engineering Manager of Glide teams, supporting a group of 12 people.

Managed teams related with every aspect of Glide, such as Web, Data and Mobile iOS Engineering to ensure its Business continuity.

Created and led an Android team that built and launched the Glide Android app from scratch.

Led the implementation of data privacy policies and tools for a successful compliance of CCPA for Glide.

Later on, when the company decided to pivot strategies, I helped grow the Argentina-based team from 10 people to currently 100+, assembling a recruitment team along the way, tailoring interviewing processes, assisting with alignment of the first candidate batches and holistically supporting the initiative.

Software Engineer & Engineering Manager | [Glide](#) (US)

June 2018 - March 2021

Since I was the first hire of Glide in Argentina and a founding Engineer: I wore many hats: Software/Platform Engineer, Engineering Manager and Argentina Regional Coordinator.

I led the initiative to scale the Argentina team from 1 to 10 in about two years' time, working initially with

recruiting Agencies and then hiring an in-house recruiter for better results.

I ran a production application with ~6k daily active users with high availability while keeping costs to a budget. Engineered different features of the Glide Application using Python (Flask), NodeJS and React. Finally, I worked on several product features, creating and maintaining all the Frontend and Backend components to support them.

Founder | Codexia (Argentina)

April 2017 - February 2019

I Co-founded a small development agency, completely managing two projects including a small team of 3 Engineers. We successfully delivered three customer-facing products based on my proven stack composed of LoopbackJS (back end) + PostgreSQL (database), Angular + Material Design (web front end) and NativeScript for mobile apps when needed.

Senior Software Engineer | [PayrollPanda](#) (Malaysia)

April 2016 - March 2017

Stack was based on NodeJS, MongoDB and Backbone. Some important things I've accomplished:

- Simplified architecture with the replacement of a RabbitMQ instance with a much simpler job scheduler (Agenda).

- Introduced automated tests and a reliable build and deploy process to Heroku through Travis CI

Senior Software Engineer | Zija (US)

May 2015 - March 2015

Perl Developer. I fixed bugs, implemented new features and made some recommendations to modernize a rather old styled MLM (multi-level marketing) system written in Perl and using MySQL.

Software Engineer | [Onapsis](#) (Argentina)

November 2013 - April 2015

Being the frontend architect and lead developer for Onapsis (Yeoman, Grunt, Bower, RequireJS, BackboneJS, jQuery) I created the first version of the modern FE for their main product.

Founder | CuatroGC (Argentina)

May 2012 - October 2013

Founder and active contributor on a small agency we started with three friends. I was PM and Developer on a project: Dingo: An online Bingo game engine 100% written in Javascript. Technologies involved: NodeJS, ExpressJS, BackboneJS, Twitter Bootstrap.

Software Engineer | [Bet3000](#) (Germany)

May 2012 - October 2013

Sports betting company based in Munich, Germany.

- I worked as a Full-stack Engineer. Added complexity because of the big amount of db transactions in real time that the site supports (MySQL) due to live bets (Perl + MySQL + PrototypeJS + jQuery).
- I developed and implemented an automated management system for remote kiosks, based on [Chef](#). This system managed Kiosk terminals spread all over Germany.

Different Software Engineer and SysAdmin roles (Argentina)

February 1999 - April 2009

During this period I had 7 different roles/jobs where a few accomplishments that stand out are:

- Developed a client-side app for an Internet Kiosk App using Mono (.NET) on Linux

- At the Argentina Gov Agency that handles the .AR DNS ZONE, migrated the root nameservers for the .ar zone from OpenBSD to FreeBSD.

- Deployed Y2K patches on Sun Solaris Servers

EDUCATION

4-year Bachelor in Information Systems at the Universidad Tecnológica Nacional.
