ABOUT ME

T-Shaped Software Engineer specialized in Infra/Platform Engineering. I've worked across a wide range of organizations in the US, from small startups to Fortune 500 companies, and have also built software for ventures around the world.

EXPERIENCE

Senior Engineer | Span (US)

February 2024 - present

- Created an API server running on Kubernetes that lets other Engineers build scalable features with heavy background-job requirements, often scaling in the order of hundreds of pods.
- As co-owner of Infra, planned and executed the creation of a new EKS cluster from scratch using Terraform and FluxCD, which significantly reduced infrastructure spend compared to the previous vendor. I also migrated all apps and services into this new setup.
- For the Data Pipeline:
 - Became the go-to person for Airbyte connectors, working with both Declarative configs and Python.
 - Built new integrations to pull data from multiple vendors, adding Airbyte incremental streams and the corresponding Dagster assets.

Engineering Manager | Compass (US)

April 2021 - January 2024

- Joined through the acquisition of Glide as an Engineering Manager, supporting a group of 12 people responsible for all areas of Glide — Web, Data, and Mobile iOS — to ensure business continuity.
- Created and led the Android team that built and launched the Glide Android app.
- Led the implementation of data-privacy policies and tools to achieve CCPA compliance for Glide.
- Helped grow the Argentina-based team from 10 people to over 100, assembling a recruiting team, tailoring interview processes, ensuring alignment with the business, and supporting the initiative end-to-end.

Software Engineer & Engineering Manager | Glide (US)

June 2018 - March 2021

- As the first hire of Glide in Argentina and a founding Engineer, I wore many hats: Software/Platform Engineer, Engineering Manager, and Argentina Regional Coordinator.
- Led the effort to scale the Argentina team from 1 to 10 people in about two years, starting with recruiting agencies and later hiring an in-house recruiter for better results.
- Owned infra for a production application with ~6k daily active users, keeping it highly available while staying within budget. Focused on reliability, performance, and infrastructure-related work around the core application.
- Worked on several product features as a full-stack engineer, creating and maintaining all the frontend and backend components needed to support them.

Founder | Codexia (Argentina)

April 2017 - February 2019

- Co-founded a small development agency, fully managing two projects that included a team of 3 engineers.
- Delivered three customer-facing products using my usual stack at the time: LoopbackJS + PostgreSQL on the backend, Angular + Material Design on the frontend, and NativeScript for mobile apps when needed.

Senior Software Engineer | PayrollPanda (Malaysia)

April 2016 - March 2017

- Stack was based on NodeJS, MongoDB and Backbone. Some important things I accomplished during this time include:
 - Simplified the architecture by replacing a RabbitMQ instance with a much simpler job scheduler (Agenda).
 - Introduced automated tests and a reliable build-and-deploy process to Heroku using Travis CI.

Senior Software Engineer | Zija (US)

May 2015 - March 2016

- Perl developer. I implemented new features, fixed bugs and made recommendations to modernize a rather old-style MLM (multi-level marketing) system written in Perl and MySQL.

Software Engineer | Onapsis (Argentina)

November 2013 - April 2015

- As the frontend architect I created the first version of the modern frontend for their main product, using Yeoman, Grunt, Bower, RequireJS, BackboneJS, and jQuery.

Founder | CuatroGC (Argentina)

May 2012 - October 2013

- Founder and active contributor to a small agency we started with three friends. I was PM and Developer on a project called Dingo, an online bingo game engine 100% written in JavaScript with real-time updates using Socket.IO.
- My usual stack: ExpressJS, BackboneJS, and Twitter Bootstrap.

Software Engineer | Bet3000 (Germany)

May 2012 - October 2013

Sports betting company based in Munich, Germany.

- Worked as a full-stack engineer. The role came with added complexity due to the large number of real-time database transactions the site handled for live bets (MySQL), using Perl, PrototypeJS, and jQuery.
- Developed and implemented an automated management system for remote kiosks using Chef. This system managed kiosk terminals spread across Germany.

Different Software Engineer and SysAdmin roles (Argentina)

February 1999 - April 2009

During this period I held 7 different roles, with a few accomplishments that stand out:

- Developed a client-side app for an Internet kiosk using Mono (.NET) on Linux.
- At the Argentine government agency that manages the .AR DNS zone, migrated the root nameservers from OpenBSD to FreeBSD.
- Deployed Y2K patches on Sun Solaris servers.

EDUCATION

Bachelor's Degree in Information Systems (4-year program), Universidad Tecnológica Nacional.
